presentations

What is shutter
speed and how
is light related?

Does sports
mode use a
slow or fast
shutter speed?

When would you
shoot low to
the ground?

Shutter Speed:

- * Exposure - how much light the image sensor is exposed to during the shot
- * Shutter: curtain that sits in front of the image sensor
- * shutter speed: a measure of how many seconds the shutter stays open
- * faster shutter speed allows less light in and "freezes" image.
- * slow shutter speed allows more light in & more blurry image.

Scene Modes:

- * Night mode - requires flash but has a slower shutter speed
- * Sports mode: to track a moving subject
- * close up - it shoots small objects and specific focus
- * Landscape Mode - focuses everything near and far
- * Portrait mode - Blurs out the background & focuses on the foreground

Snapshot Tips

- * Pay attention to headroom, fill in the frame
 - * Don't be afraid to get in close (you can crop out from the waist but not the joints)
 - * Remember your knees can bend
 - * Lead your subject
 - * Watch the background
- ↳ get low to the ground w/ children & small subject

Backlight & Coverage

- * backlight messes w/ the light meter

* don't crop @ joints (neck, elbows, knees)
* Coverage - move around, try different angles
